

From Specs to Automated Tests — One Pipeline

An AI-assisted test-plan & automation pipeline for ATE, QA & V&V teams

THE PROBLEM WE SOLVE

Every release cycle, verification teams redo the same expensive manual work: read the spec, the CLI/API manual, and the relevant RFCs/standards, then hand-translate all of it into a test plan — row by row — before anyone can even start automating. It's slow, inconsistent between engineers, and hard to audit ("which requirement does this test cover? which *MUST*-clause did we miss?"). Test-plan authoring becomes the bottleneck that holds up automation — not the automation itself.

WHAT OUR SYSTEM DOES — END TO END

We turn your **own engineering documents** into a **traceable, review-ready test plan**, then into the **automation skeleton and executable tests** that run in your CI — one continuous pipeline. Every test stays traceable back to the exact requirement, command, or standard clause it verifies. Nothing is invented; nothing is silently dropped.

■ Solid = live today (specs → traceable, review-ready test plan). □ Dashed = the intended next phase — the same structured plan drives automation-skeleton generation, executable tests, and CI regression runs.

WHAT WE INGEST

Source	What we extract
Functional specs	Requirements, behaviors, config semantics
CLI / API manuals	Exact syntax, parameters, defaults, modes
RFCs & standards	MUST/SHALL mandates, as first-class reqs
Parent / inherited specs	Sub-config the feature doc assumes

We fit the pipeline to *your* sources, and match *your* existing test-plan format — no retraining of your QA team.

PROOF POINT

The pipeline is in active use generating compliance-grade test plans for a networking-software vendor — ingesting vendor specs, CLI manuals, and multiple IETF RFCs into one traceable plan with automated standards cross-checking. The same approach applies directly to **IoT device, protocol, and firmware verification**, where device specs + connectivity standards + certification requirements create exactly the same multi-source authoring burden.

Let's talk. A short technical session with your V&V leads is enough to scope a pilot on one of your features and show the generated plan against your own documents.

WHY IT MATTERS FOR ATE / QA / V&V

- **Weeks → hours** for first-draft test-plan authoring.
- **Full traceability** — every test maps to a requirement, command, or standard clause.
- **Provable coverage** — auto cross-check flags MUST/SHALL clauses your spec misses.
- **Consistency** — same rigor every release, independent of who ran it.
- **Automation-ready** — the structured plan is the foundation automation builds on; we unblock the bottleneck *before* automation.
